Docket No. <u>5000-5253</u>

Listing of the Claims

Please amend Claims 3 and 4 and add new claims 7 - 8 as follows:

1. (Original) An FM receiver, comprising:

first detection means for outputting an RSSI signal indicating intensity of a received radio wave;

first time constant setting means for setting a first time constant in the RSSI signal;

second detection means for outputting a detection signal corresponding to a high frequency component included in an IF signal;

second time constant setting means for setting a second time constant in the detection signal outputted by the second detection means;

arithmetic means for outputting a signal obtained by subtracting a signal based on the detection signal from a signal based on the RSSI signal as a control signal; and

control means for controlling at least one of a stereo-noise control circuit, a highcut control circuit and a muting circuit, according to the control signal.

2. (Original) A noise eliminator for an FM receiver, comprising:

first detection means for outputting an RSSI signal indicating intensity of a received radio wave;

first time constant setting means for setting a first time constant in the RSSI signal;

second detection means for outputting a detection signal corresponding to a high frequency component included in an IF signal;

second time constant setting means for setting a second time constant in the detection signal outputted by the second detection means; and

arithmetic means for outputting a signal obtained by subtracting a signal based on the detection signal from a signal based on the RSSI signal as a control signal.

- 3. (Currently amended) The FM receiver or the noise eliminator for the FM receiver according to elaims 1 or 2 claim 1, respectively, wherein the first time constant is larger than the second time constant.
- 4. (Currently amended) The FM receiver or the noise eliminator for the FM receiver according to claims 1 through 3 claim 1, wherein

the high frequency component is due to multi-path noise.

5. (Original) A noise elimination method for a FM receiver, comprising:
subtracting a second detection signal which has size based on intensity of a high
frequency component of an IF signal and has a second time constant from a first detection
signal which has size proportional to intensity of an IF signal and has a first time constant, and
using a result of the subtraction as a control signal; and

controlling at least one of a stereo-noise control circuit, a high-cut control circuit and a muting circuit, based on the control signal.

- 6. (Original) The noise elimination method according to claim 5, wherein the high frequency component is due to multi-path noise.
- 7. (New). The FM receiver or the noise eliminator for the FM receiver according to claim 2, wherein

the first time constant is larger than the second time constant.

Docket No. 5000-5253

8. (New) The FM receiver or the noise eliminator for the FM receiver according to claim 2, wherein

the high frequency component is due to multi-path noise.
